MODA + CHADA

...from H2020 MMAMA and NanoBat

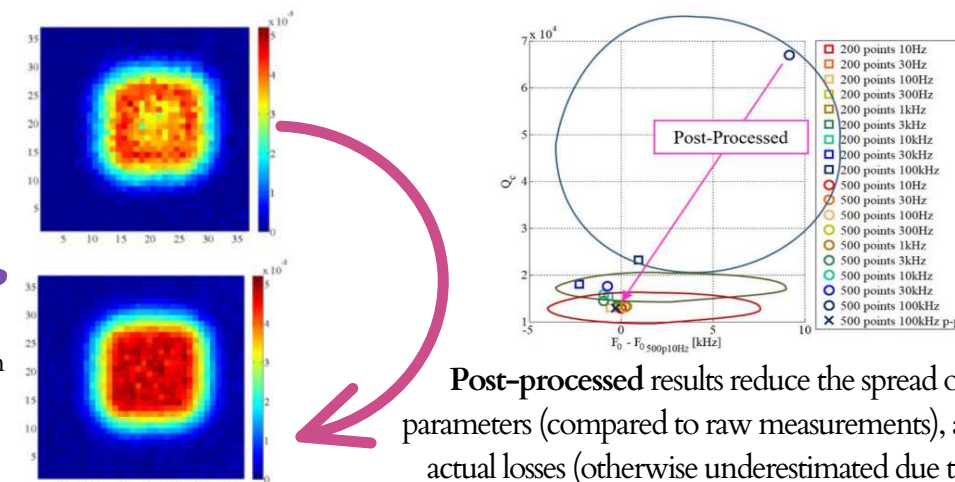

NanoBat aims to develop a novel RF-nanotechnology toolbox for quality testing of Li-ion and beyond Lithium batteries with the potential to redefine battery production in Europe and worldwide. A particular focus will be testing and quantifying the electrical processes at the SEI, which are responsible for battery performance and safety, but difficult to characterise and optimise. As SEI formation amounts to one third of battery production costs, the project will reduce such costs significantly and hence benefit the evolving clean energy and e-mobility transition in Europe.

A photo of the imaging system built of the 2D SPDR scanner

Implementation in the form of surface scanner for GHz-imaging of electronic and battery materials - Finalist of the European Innovation Radar Prize 2021.

Post-processed results reduce the spread of material parameters (compared to raw measurements), and reveal the actual losses (otherwise underestimated due to the noise)

The aim of this project is to accelerate the development of high efficiency cells and to have measures to predict performances in early stages of prototype production. Where process monitoring of materials with nanostructures is necessary, a dielectric resonator is used to translate insights from scanning microwave microscope measurements to fabrication environments.

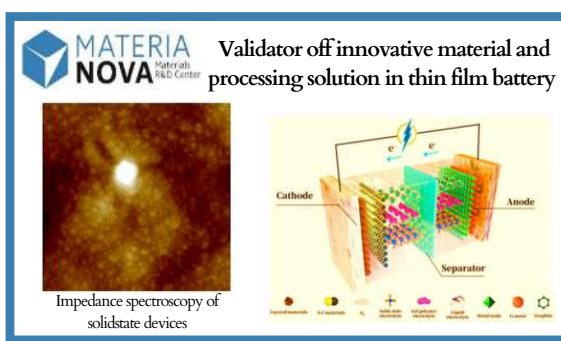

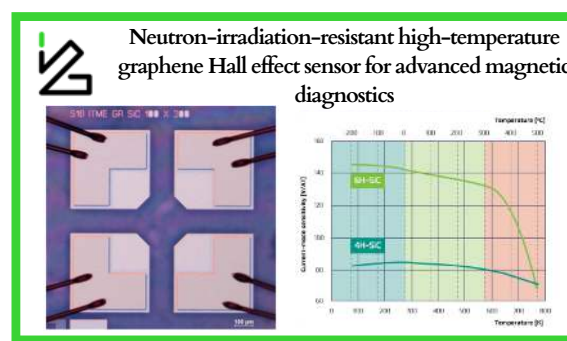

licence-free CAD modeller focus on User Cases relevant to SMM, dielectric resonator, and coaxial probe material measurements.

...to M-ERA.NET ULTCC6G_Epac and I4BAGS Projects

The I4BAGS project aims to develop innovative processing and characterisation solutions for microelectronics and battery applications. Driven by topical challenges in communication and energy management, and supported by large industrial demand for innovation.

ULTCC6G_Epac

ULTCC Materials samples under investigation

The main objective of the ULTCC6G_Epac is to develop novel functional materials based on advanced multilayer technology (ULTCC), characterise their properties (e.g. dielectrical) and to demonstrate and validate the telecommunication devices based on the ULTCC6G_Epac.

Sample name	Thickness [mm]	Dielectric constant	Loss tangent (±3%)
Sample 1	0.485 ± 0.015	5.40 ± 2.5%	0.00200 ± 3%
Sample 2	0.64 ± 0.030	6.52 ± 4%	0.00233 ± 3%
Sample 3	0.6 ± 0.030	5.12 ± 4%	0.00195 ± 3%
Sample 4	0.55 ± 0.020	4.48 ± 3%	0.00328 ± 3%

Acknowledgement

The work received funding from the European Union's Horizon 2020 research and innovation programme under grant agreements MMAMA No. 761036 and NanoBat No 861962, and is currently co-funded by the Polish National Centre for Research and Development under contracts M-ERA.NET/2020/1/2021 and M-ERA.NET/2021/83/I4BAGS/2022.
